

EfficienSea2 results exploited at innovation camp in ROK

Human factors, new standards for hydrographic data and how best to exploit data were in focus when Korean and European organisations met to collaborate based on the results from the EU-funded project EfficienSea2.

The workshop was opened by Brian Mikkelsen, Danish Minister for Industry, Business and Financial Affairs.

On top of European partners, the workshop also had Korean stakeholders such as KJ Engineering, San Engineering, Korea Research Institute of Ships & Ocean Engineering, Korea Advanced Institute of Science & Technology and the Korea Hydrographic & Oceanographic Agency.

The main topics for the workshop were the MCP (Maritime Connectivity Platform), S-100 standards and how human factors played a role in maritime digitalization.

Ann Lemming, Communications Manager for EfficienSea2 and head of section at the Danish Maritime Authority, explained: *‘The innovation workshop was a unique opportunity for exchanging experiences with a leading country in regards to technological development. It was also highly beneficial for gaining inspiration on how to utilise the results from EfficienSea2 and thereby fostering innovation that goes beyond the project itself.’*

Global partnerships

Throughout the innovation camp which lasted for two days participants had opportunities to work both in plenary and in smaller working groups. One issue first being discussed in a smaller working group and then carried to the plenary was how to exploit the data models being developed within EfficienSea2.

Ann Lemming concluded by saying: *‘It became obvious, that while some parts of EfficienSea2 are instantly usable in the real world, other solutions are still some distance away from being operational. This however, does not preclude the data from being used in for example maritime training and some of our workshop-participants have some very interesting ideas in that regard.’*

EfficienSea2 Announces Final Conference

Topics being discussed in Korea were just a fraction of the many being developed in the EfficienSea2 project. The full range of solutions and services will be demonstrated at the EfficienSea2 final conference on 5-6 April in Copenhagen.

That conference will give the participants a chance to gain insights into the future of e-Navigation and digital shipping.
